

Logic Puzzle

Firstly, my first step would be to transfer the student to the other side of the river. Afterwards, I would go back to get the nintendo switch and bring it to the other side but I would leave the switch and bring the student back to where the professor is. Hence, I would leave the student there and bring the professor to where the switch is and finally, I would go back to get the student and bring them all together on the other side of the river!

Weekly Reflection

- One thing that went well for me this week was taking my weekend to relax completely after I donated blood on Thursday and taking a day off on Friday because I only had one class. I had a lot of fun chilling out and de-stressing.
- A challenge that I faced was also being okay with not being as productive this weekend because I'm more used to advancing my homework for the week before to do myself a favor but me not doing that didn't make it easy to relax but I overcame them by at least progressing the project to debugging earlier than I thought.
- A concern that I have is to fully debug the project so that it actually shows up as I want it but that's coding for me
- I plan on carefully doing better research on the miscellaneous errors and rely more on searching up to optimize my code. Additionally, I plan on not slacking today so I can get back on track.
